High Speed Converting meeting in Nanjing

2026年10月27日 12:58

00:00

We would like to ask Jerry to have a brief introduction, what is the coco v six for.So Jerry, I would like to pass on to your right.所以可以跟你确认一下。加A加K，然后选C。应该是在K。这个系统是经换的是吧？是的。或者你直接打开WiFi，连WiFi连接wi KT也行。你可以在这边待一下。我在这儿开了好几个地球，但是我不道。在选择外卖，那外卖的。人家开没，但也只只有一块，因为你开出没办法。啊，原来是这样，对对。你在看我的。但是。那所以这个我，嗯。好的，那个明天开会的话。

02:12

Okay, there's something wrong with my computer. I will not share my screen. I prepared the samples here, take a look at that. I will give a quick introduction on the product design. I assume you are very familiar with the sample. We reproduced it through the high level machine line because we have several rounds of internal meetings to discuss on that.

02:38

So there are two winning design we bring out through the.天津寒冷，我醒来，汪友则离不开了。

02:46

Second one is considering the flat testing results and also including the chef cradle.

02:56

In take testing. This is the pattern with spring out. But I don't think this is the fixed one. We cannot modify it or optimize it, it's not correct.

03:08

So we plan to provide a kind of design principle to the local marketing team.

03:16

To give some guidance how to design pattern like the. What is the dimension of the pattern that we need to design?

03:24

Like we, we should have the multiple one or multiple one combined with the branch.Help to distribute the urine.So, uh, yeah, this is, this is a pattern design standpoint and the second one is we also try the.

03:41

Different RA because there there is another idea from engineering team that can we place just one layer of the.

03:51

Leaf pattern on the top there. Just keep the simple pan bottomment at the top of the bottom. We run the trial, but unfortunately the performance is not good. Meanwhile, we cannot have a very

strong education even on dry and wet. So we will keep this.

04:13

Approach, which means we still need two layers with a special pattern design. And is the Ari all cutting that layer? No, no, it is not. I had three. So when we look at those patterns, that's just the same as there players not. And then they're still putting a surge patch on top.

04:40

搜索。Oh, you're tell works supporting layer got very low basis with SMS.

04:53

How well can you see the pattern through the topicals? It's very obvious after. After it soils, yeah. Then I think Jerry, those words you described are important, yes. Like almost, I think you said to the marketing team, but for us it's helpful to say.

05:21

It's two layers of sand. Arielll layer not being. If the oils not cut, that's the way. And then I think it's also like what's happening with bonding.

05:38

That's a great question. We need bonding. We are trying the extraicing in the APP. I think at the end of this year, we will try to pressure on because we found the AO function. We destroyed tber, so when we bonded the channel through hysonic bombing, the third cradle would take time getting work. That's why I always try reasonable change. We need money, but we no need that money. Not Nobel.

06:19

But without the bonding, the sand will swell and fill the void and also they. So basically it is a five structure to call correct, and in the middle there are two different. I'm trying to correlate this back to those indices that you showed us last week. So this would be the upper left I think. Right, and did you say two types of sand? Because it will enable two types of.

06:57

And the next round from the Tianjin pilot line, the FBI I Jes team would like to understand what's the stem allocation.

07:07

Add on coverage and also the density. I will show you comment later. I'm curious on the one where you only get the top player. I don't know if there's anything from the testing. I mean, if that's a surprising result that it was not good.

07:27

Creole. 也没C高手。 Know when I see the Jerry Sha is actually I'm very surprised. Or I mean one layer channel.

07:42

Two layer channel have two layer channels. It's better one layer. Why? Yeah, this is my question. Potentially that could be the void water because two layer of channel add more void. Potentially does your wedding pattern change? Do you get a wider pattern when you have shackles and booth?

08:05

Of layers of sample.Yeah,so it was your a bigger wetting pattern does it?The fluid spread out further.Fall under the u shape.For that testing this.You know,when I say this,the first question is.

08:27

If one, one layer pattern is better, no, I mean two, two layer pattern better one layer.

08:36

And.What is the result of the we?I mean,it's the same structure as Co.You.S what is the result of this?It means the two layer pattern is better than one layer and better than.I said that if this is the logic.Right,because then you have no no pattern,the Kobe design.I think I will give more detailed explanation on this point later,so just more flexibility.Another thing is considering the timeline currently we use.You won't mention China leadership team.Has three.PE we can.

09:30

Make it happen as soon as possible.

09:33

Can we commercially next year?No,no,we cannot be possible but we will try twenty twenty eight.But not commit,so that's why I'm here to.The discussion between the engineering.谢谢啊。

09:55

Is the arial cut or not cut?Z already defined and you',not.No face one we will not cut,but on the face three or Phase Four we need to cut.Know you need to cut what you.No we we want to cut it for a better performance,but it will depend on the entertaining capability maybe on the Facebook face two because the management has a more demanding we need to come in on the timeline,so we just give up the I cut it only in the face one face two.嗯。

10:35

Okay, so finish, finish, okay, only ten minutes.Okay, so Claire, can you go back to my thread? So I, I would just want to interpret what from the product design standpoint and what will be the nice process to make these from my.

10:58

Learning and my personal understanding.I may eighty percent may be correct,twenty percent need expertise like here try to verify in the near future.

11:14

Clear对，继续。So it's just in echo with the ah Jerry's ah product structure. Actually this is a five layers absorbent core structure but when we are more focused on the patterns or different patterns and the different shapes of the absorbent core, I would like to interpreter from the

process side. I actually the process it doesn't matter which kind of pattern is making and we doesn't matter what's the performance, we just want to deliver the most flexible sap density add on anywhere we want.

11:56

So for today's discussion target actually we just simply set up a some basic target for today's discussion, the the target is we want to have a decision making by the mid of November which direction we will go either we retrofit on the existing nd thirty three.

12:19

Or we have a creating new pilot machine in the Beijing machine bay to make this process happen yes, we want to have the nd thirty three to be ready or can be retrofit. There was two options on the nd thirty three we have insert and build up, this kind of cocoa basics process on the nd thirty three we need to either enable the PD p production, the full structure of the PDP structure production on the n d thirty three and we need to have a.

12:58

Sideline that only collects the coco v six absorbent core to like a box collector, that enables us to have these on ratedarsorb core to be feeding onto the no nd thirty three in the China machine so this could be a slightly amendment here, so target is we are looking for the n thirty three we need to two options the whole pdt product or only the absorb and if.

13:29

The product itself actually we are working on and talking about is,ah five layer material structure of zone core,that will be including the two call wraps and two different kinds of the SAP for more future flexibility,and the for the face one we already focus out one hundred percent sap.So that is either we are looking for the s aap one and sap two with nothing else,only the s aap,that's one hundred percent that's all phase one for the phase two discussion we are thinking about because just from the level research on the Jerry king's product,we have figured that only we have win on the flat but still we want.To win on the c cradle situation,so for the phase two we would like to think about to add a minimum fluff into the sap two out the abs solvebnency layer try to.Enable the capillary absorbency.

14:32

So the GSM add on or about the flap layer we are thinking about is around thirty GSM or roughly about one grams of the fluff into the layer,but this is the phase two and the what on the face three we are looking for is the on the I your car,if we can cut in the I l with the same patterns that in al line with the sap pattern,

15:02

that is something we are thinking about for the phase three and for the Phase Four we are looking for if we can be successful in the.

15:11

Earlier phase we are thinking about.Replace the poly SCI SAP with the conventional core which is a hybrid something like the fluff and the sap on thisly.So totally my understanding and my interpretation will be separate this kind of the project into faithful,are you worried about the loss of or loss of thinness of the core by replacing.

15:41

Putting the fluff back into the corner.And also because the minimum we have a slightly high speed on the open diaper for the b cm.

15:54

Ah and also the the major demand is coming from the pants because in these markets only newborn and the small size probably we'are thinking about the open diaper, but after six month period maybe the moon is more likely to pick up the pans, so that's why the reason we still think about the solid the PM for some kind of a effect, if you walk because the majority of the worry is coming from the pants instead of the dier even the diaper were raining high speed then you solid d m.

16:29

And again, when Jerry is mentioned before, we probably want a zoning the pad and also we were looking at a shape pad and also we are looking for the pattern ASAP.

16:43

So I will give more clarification later on what's my understanding on the zoning, what's my understanding on the shape, and what's my understanding on the, uh, pattern.

16:57

So it's just when we go back to the product structure standpoint, this is originally today we are we are we are talking about from the line of side s sap and from the poly side s aap, we all want to make the patterns and ten percent of the fluff is so sensing local on the face two but at the initial standpoint, we just focused on one hundred percent SAP in the policy side.

17:27

And when engineering and I thank you for Lock and Gavin. We are busy working on this kind of structure. Also we have demoed some kind of a product structure at the Tianjin pilot line to make up patterns on the line of side. And no patterns majority like a political process on the po side. And some kind of the figure out today is, we don't recommend it to go in these direction is up because of the four reasons. The first reason here, if you were looking for the function about the two different layer of the sap here. Most likely the skin side sap it need.

18:18

Acquisition. Other than the distribution, but for the second layer about the SAP, you need to work on the absorbency, absorb the quick vortex or something like that. So remember, if we are looking for a TQ, that's one of the benefits coming from the line of S side.

18:41

If you add the amount of the SAP on the line side and the poly that you will sacrifice BYD absolv, but if you all have a right that have a less add on the police side, on the line side, I'm sorry, less SAP, you make a pattern less basic, you can win.

19:02

That's is first point. The second point is remember on the phase two, we are looking for the fluff to simulate on the obsolbvency on the poly side the current breather the process, we just a layer to layer the fluff and the SAP what our ideal position is try to mix the fluff with the s aap, because in this kind of region we are looking for something seen. So that's why the reason we just promote the ten percent of of fluff Adam on here but maybe in en countries, maybe in Australia or maybe in the Indonesia for that a long time absorb system stand point we can increase the fluff to fifty percent. If we want so this is another reason, the second reason is on the zoning.The zoning for me, it means the different sap density, so.

20:01

If we using the jump process here we can make a different SAP density across the MD direction. If we are using the blizzard process here, maybe we only can use eighty two point zero make a three different sections about the zoning, but how about if in the future we need to five different zoning because this layer is for the abor instead of the business.

20:29

Also in echo, with the poly side, we can divide into five different sections about the five different absorbency if we can segment any sections that we are looking for. I will give more explanation later for this, but again you just need to build up some idea about the zoning coverage and also the density.

20:57

The three of the first side the structure, it is just to increase the flaff percentage at the police that. But there was no residual no patterns here, this could be we with not no direction. But if we build up a process, actually the process enabled this kind of structure, it is quite simple, it just.

21:27

Process is not simple but the idea is simple, it'just to enlarge the fluff atom here, but for the force maybe that is sensing in the Phase Four development, we need to think about if you're using a same platform ISS just making a conventional fluff and stem with a patterns here but.

21:48

I would like to modify my saying on the patterns. The patterns is only a special situation when the sap density is zero. I would like, from a technical standpoint, we need to build up a process to design at any SAP density anywhere we want, as in the past.

22:18

屋企？ MY, my personal interpretation about what my big boss Jerry is asking for, just from how we build up the process will be the ma.

22:31

Basically you could take about twelve hundred PPM design speed, but again to sacrifice and a compromise on the open diaper because the borrowing is low. Actually we are more focused on the pants because the pants boing is big, so I think because it's a new process for kc, new progress for anywhere. So we will think maybe if we can be successful in actually running at the thousand PPM it will be a big win for us.

23:03

Even if it is a tough target, we can persuade the management team to think about nine hundred PPM, think maybe nine hundred PPM is the right number, but anyway we can make the compromise on these kind of data. This is the only my understanding. So after we have a more deep dive discussion here or by the middle of November, we can modify this PPM target.

23:29

One comment on that, Brian. I think sometimes the words we might use, what I hear you saying is the intent is that it starts up and runs at a thousand products per minute in 2029. I think that's what you're saying. But the design speed probably wants to be something higher, like the motors are capable of spinning at a higher speed. So that's why there was like a twenty percent over the design. OK, OK.

24:02

So we need to learn about the five layer structure of the products. I think there may be something missing. Or maybe because there was overload, there were eleven different sizes of the pad we need to think about. So I will translate what this means later in the next pictures. We need to have a very clear message, visual Q, at a channel pattern, so that means there are no SAP density in the channel that we would like to know.

24:46

By interpretation. For the point of five I can talk later, there was a special slides, later.

25:00

So the pattern alignment on the line of side and also poly side needs to have a very good registration to make sure the channels and we create a good VCQ. Also we are creating a very good voice warning because of this kind of high speed.

25:18

We are already talking about that in phase three. Again, something we don't know is, at high speed, how can we control the pathway deviations.

25:33

And on the phase three we are talking about it to be better, we can cut the IL to create more voice volume and also make it easier for the channel bonding in the near future.

25:51

Oh Claire, I'm not sure if you can just show the picture I just sent you before in the teens.

26:02

Actually, another thing we started to mention here, I just want to give the team more update. 就直接投屏就可以了。 网速好慢。 Brian, a quick question, although we.

26:34

So you talked about the bonding and embossing? Bonding, yeah, and then you talked about Ariel cutting.

26:40

Assume at some point we might evaluate just the body, and might give you the visual as well, yes. And not the cutting, we know it is not like this. If we agree cutting is not needed, but if there was a cutting, we will build more volume to enable some kind of flat situation distribution.

27:05

OK, Claire如果实在不行就算了。 Natural transition, my thought was the bonding is going to crush it in. And also to control the free set, it was important due to the do. Sleep. 是。 Future.

27:51

Okay this slide will show us all different sizes, all different sizes of the pad that we are going to run. So the difference that I mentioned here is.

28:06

We have the empty lens, and we have the CD width here for totally eleven different kinds of the pad we are going to run. We have what should be the current per pad, and the sap add all data if we are working well and design well. Actually the same density is the total target we are running on the purple v six.

28:30

And when the first assumption is we need to reduce the standard add on here compared to de because compared to our original we have a better design, so if we are use current sap at all.

28:46

We have calculated this is the s aap, GSM, the sap s density for each different size.

28:56

But the assuming in the near future if we are looking for the line of sight SAP and we are looking for the poly side SAP, the different sap take up different functions. Assuming in the future the line of sight sap we need a high aul, high g BP and.

29:18

Bigger PSD for a particle size distribution because big particle size distribution easier for intake. And for the poly side is the main layer for the absorbance. Assuming we need a high CS, we need a high vortex and also we need a relatively small PSD to try to avoid the hydrogen block issues. So, if we have a current rate, because in the China design we are home SAP only coming from the north five eleven, so we only pick up one. But for the coco v six that high possibility we were

separate free to the line of side and the policy, so in that means because the SAP if we are positioned at a targeted with a different functions.

30:12

What will be the line side and the poly side pool about this kind of SAP? If the process we are running out the half to half.

30:24

That is the SAP density if we are learning on the two your process that is the each job the.

30:31

Sap density we need to run but the ultimate situation.呃，clear.我觉得好像这里哪里有错的，The ultimate situation is seventy percent versus the thirty percent job,so if we will keep thirty percent here.The biggest size.

30:53

The SAP density,that's the machine design,we need to have a tolerance almost like a two hundred and sixty.Yeah,so thank you.So what what would happen you have.

31:11

To balance out your absorbent levels, you want to have like thirty percent of the high al sand in the top layer. Then, because this kind is only for intake and it's not good for the reel if we keep the same amount of these, the reel may be hot. So you would want a higher basis weight of that high c rrc sand in the bottom there.

31:37

Then you have the high AO and the top layer so you're no longer running the same basis weight in both both your sand layers. Now you're now you're putting this is my interpretation, we haven't got passed yet but I think for the next round of the try all my big boss Gary is target different different, so so this is getting at I'm trying to separate this is getting it using differents in each way yes, but it's not is it not really how important is it relative to what we specify.

32:14

We never told them we don't. We just need to tell them each job we have a capacity target. At some point later we get the equipment and we put two different samples with differentness, then they already have the building, they know how to do. But what we don't tell them is that density that we are targeted year business they already have.

32:42

Two different densities of stem in a complex structure and then.You know,question to bring,you know.Different layer,a different type of sap I don't know if North America nhave has traveled for.No,we are the pioneer yes no in Indonesia.

33:01

We tried before. The time is A. Because in Europe we have two tanks. Output. And try it different set. We don't see a big. So. I don't know if you guys did tested before or not because even like I

think like Buck Belly we have strong. So next month at Casey PX, we're actually running a trial with two different types of sands and multiple con.

33:37

Issues to try and figure out what that looks like.I guess no, it doesn't have it already yellow in the middle.It's just two different stands on top of each other.So it's like.

33:50

And what I'm trying to get straight in my mind is.I understand the potential of the two different sams, I understand how you would want to.

34:00

Do the testing and development on it, but relative to like do we we want to get this equipment.It seems like it's a little bit separate from that, like you would expect you would be able to specify the equipment.

34:14

Without anybody knowing anything about the you have to have two sand, because we have and also each density that have two bag for the purpose of the issue discussion there where you're specifying Sam here one wrong one yeah, two and also the two hundred sixty target.

34:36

Maximum two hundred and sixty target that is something we need to specify.And also, and also there was a different understanding about the s aap layer add on. So add on here it means how many grams of thetem we will apply on the line of side, and also it is related to if we are defined the size is related to the sickness.

35:07

And the zoning, even we have a specified add on at the line of side of poly side, still we can do the zoning for each layer.

35:23

I'm not sure if I'm explained the correctly or easy for understanding we have a certain amount of add on for each target, but still we can make that each target the layer is equal from end to end, but still we can make a make a sap density different from here to here, right so so later one you have a different profile for example you you look at if you look at it if we want separated the urine distribution majorityly, the high urine is accumulation at the notch area right.

36:03

Are slightly infer is slightly bigger here is slightly bigger,but the two add may be very less so if we want to better use of the sap we need to think about.The absorbency layer on the poly side need to activate here,but again.That was another question.

36:26

Is the thickness of the LLSS layer kept the same, or do we just keep a different SAP, add up a different SAP density for the SSS? So this is something different we are working on, the add on,

and also we are working on the density.

36:46

Again, what's the coverage?The coverage that means if for the p ss, we are looking for the whole size.But if we are applying the same coverage for the lss, probably not, maybe we just need the lss coverage like this.So from a process standpoint, need to and Mai enable all the possibilities.

37:18

My question question.This final I understand that there is more.Possibilityilities but if we like to.

37:29

One by quickly. Different asset, different tank in this space, they also need money. So why we come to test this with the current machine? I mean we have different tank.

37:45

And why we can't get this conclusions? It's really have I mean we have different ass on ls and p ss yes it make different American performance good.

37:56

WHY? Why we can't get this? No, we are talking about a pilot line, we are not talking about the production machine so pilot line need more flexibility that we can testing everything and you're going to be able to test you either way, just based on the two like it's going to have to see.

38:17

What you actually put into on how you. Meter of we can do that learning later. Well, as long as they have the ability to feed in this range, correct, which we can build some.

38:30

And we'were planning on doing the experiment, we'll get some, yeah, but you're still going to want to do it with this, yeah.

38:39

Now the part we won't know is the same density part time.That's going to be a little more difficult to do to creates well,I think that this question I why I have a more detailed explanation,that is the peration why finally we was that to job no matter it is the outside of vendor,the building or Casey building the tools to job system enable us with a different add on,enable us with a different density on each layer and enable us to have a different coverage on each layer.

39:16

So quite simple and also the drum can have a forming chamber to have a flux here.So that's a back to the question that Gavin is asking for before.

39:29

But how we build it, that's an engineering solution, you are up to you guys.

39:40

We won't talk to h age about the density, no no no no no because the density it can be made by the vacuum, can be made by the open air. I will discuss later. What we only need is build up a basic platform that enables more flexibility. So from the market demand, if there was something change in the near future, we have a same platform to retrofit most simply to make all different kind of products and launch the product more quick. They are competitors in the market.

40:14

So first this,this,I mean if we buy the equipment.Pilot line yeah,definitely.The second is what we buy from ich is the equipment.It's not Tech technical.Right.Is it quick versus support?

40:34

Yeah, I think we would have to do develop so like question just it just it is now any is or that's that's what we've talked so far I think that.Because once you get support, then they写得不太好，这可能是游戏，有可能是游戏I。

40:59

Should be recognized by our our production means the equipment has the capability meet we need what we need, right we yeah I yeah what are we buying from that does finally, we need ourselves to return to because lot detail not confidential thing we cannot talk with the vendor so ideally.

41:29

Engineering team can build up ourselves but the requirement is that we need a more flexibility for the first pilot line is basically number one show, yeah it's it's not already understand.So we would have to internally develop two, three, and four, modifying their equipment, yeah, and also I think the density and the design on how to separate the MD direction that echo with the urine accumulation, that's super confidential ISS k cp.

42:05

We never tell them anything, we don't want them to come in and be joint, yeah, and also the selection, which kind of the set are the top and which kind of sound on the bottom is super confidential as well.Yes, so like when I think about tomorrow's meeting with HCH in general, the approach is to try to figure out what do they know? What are they capable? Yeah.You probably want to.Ground the group a little bit of what has been shared with thech so far.We know what they know and what they.Believe the ask is yeah.And then to spend most of our time trying to give them as little information as possible.

42:48

From ourselves and get as much information from them as we can.So as they're proposing these pieces of equipment, ask them what they know about it, what's proven.And like what's the what the unknown risk, right? So it's important to get their technical judgment, but then also to get the background between how they came to that decision is just yourre technical judgment.

43:14

Have they done some basic trials on it or have they commercialized it? So what's, what's their level of confidence, what they're proposing? What's their level of knowledge.

43:24

And once they're actating right to save the time we can read this part to later but anyway, for this slide I need to have the team can I understand what means on the add on, what means on the density difference and also what means on the coverage even we can have a smaller lss and a bigger.

43:45

Ah pss that is something we never touched before, but this is so called like a coverage difference so it just need to have this kind of terminity so that yeah the coverage wouldien. So just have different can you all find set density and zone density and set coverage one more time, yeah so so so for example the zone zone density each layer you not think about the two layer, you only think either the lss or the pss we will not have the flat sap, we want to have the zoning work that echo with thes, and there could be m the or follow by the main remaining and and you have no that why you're. Saying layer on the bottom and then a smaller same called the relatives okay relative okay I think just based on.

44:45

We only equipment but one thing we need consider before equipment is based on what.Equipment is based on the input,equipment is for the production if no inputs how to make the equipment and that means we have to share something with no the hch.I will show how much how many I already showed it so I will I will let you guys know later.So it's very general basically Right No no like this on your yourself cover you want to be able to vary the with and the way you know,I cannot also you this questioning,but I just don't want to have the equipment to have the capability to offer the best of people to the question you this,I think its kind of circle back to that.

45:41

Whatever was shared, even if it was general yeah, ideally we would then be able to tell them we want you to demonstrate that you're capable of producing this general whatever we stated, right? That's kind of where you if we have that.Then we can.Then we can take it and do all these other things.

46:03

Yeah, that's why at the beginning we will show what we have told them and they will show what they, the rent, what for me to the design criteria we can, no, we accept and ideally. Again, what I need engineering friends to figure out for me is, according to the airflow philosophy, if we are thinking about adding a fluff on phase three, actually to determine the lengths, this is the ideal CD, that we can have a very good mixture of the flup and sap. When you determine this kind of lengths from the forming drone standpoint, the height where we dip the sap and the fluroff is coming over, we can make a very good mixture and again sensing in kc. We don't know yet, we

never control the SAP particle size distribution but according to the airflow law the heavier sap goes the farthest fastest.

47:13

If we are looking for a very good accumulation of about the solvency, they actually are there from the reality standpoint. Even we are defining the PSD, there was some kind of deviation on the PSD as well. So need to figure out actually what's the dropping ratio, and also what's the dropping height about the model that we are coming from the sap to the Bobby Johns standpoint. Need engineering friends help here.

47:46

Does this nozzle exist? Does a nozzle exist today? Just theory, we don't have a matching now, so that is something and this could be some critical area we never told that. Where's the background? I don't know we write like this but I'm curious where did this come from? No, this is I will show you later in the protest but again this is a sense we don't know, it looks like Andrew Baker. And even if this uniform is a security, because I don't want to lie that the big SAP is also sitting on the bottom that could be inferior on the ABS performance. You're talking G, right? No, the pure SAP, pure.

48:42

Now this is with the ten percent of flap, this could be for the p percent, so ten percent, ten percentlo, yes. Because we never had so much small amount of the fluff before, right? What we will add is at minimum like a thirty percent, but now we are talking about ten percent.

49:06

So, when we are looking for the process, no matter for this kind of coco v six, there was the three variations. One is the forming pressure that is coming from the forming fan.

49:21

But something different here for the forming fan, that it generates the pressure. Then part of that we need is inverter technology so it can be programmed accelerating and decelerating by the actual performance. So the forming fan generates the pressure vacuum which needs to have a good capacity and could be automatically adjusted by the inverter technologies. The second is, once the forming fan has a pressure, it needs to hold the substrate outside of the vacuum to make a good forming.

50:01

The second variation is the open air on the screen. If we were determining the target sap density, we can select and control the RPM of the forming fan. Once the capacity of the forming fan has been defined, we will determine the right r from this selected forming effect to generate the original vacuum. But this vacuum can be controlled by the different open air from the screen. If we can design the screen open air according to the density that we are looking for in a special area in the pen.

50:49

That is something we can work out a different kind of the sap density is coming from, but how to define these energy that this open air percentage we don't know, but this is there that is something we need to figure out during the pilot's life.

51:07

And this is also the critical thing, we don't want to teach SCH. From the HC standpoint, we just need to make a very flat one. Also the philosophy here is that if you have the vacuum going through with substrate, you can get to the AP. The bigger volume of the vacuum you get, more sap density. And the less volume you will get, less sap density. This will enable us and the why.

51:38

Tong Tong, my boss rejected the 8.2.0, because it is not flexible enough to make the MD and the CD different. Pans only means if you are looking for this kind of two-year process here, you generate the pressure here. If you make a shift the pad, if you make a different kind of the channels here, and also if you're looking for different sap density for both the lss and for both the pss, you just change the screen that'.

52:10

If you can well design the airflow system mechanic, I probably need help from the brand. The part of this that I wish we could maybe have the theory behind it, but the whole time we've been talking I think it is worth for study. Yeah I'd like to be able to put a.

52:34

Like this design into a simple statement. That we could all get our minds around and then the theory.

52:41

Like be confident that the theory and you know everything we know abouts see then tells us this is the best possible design you could specify.

52:53

Based on that theory, you know if we could have that then I think we don't know what what do we know is this mechanism works, but we don't know is how much open air on specific sap density we need to in correlation, that is something we know we need a line or a pilot try to learning this kind of the correlations.

53:19

Yes. We talk about specifying a generic system for HCH. For this, we will have to specify how much. I think based on my understanding, HC they know how these works, but they don't know we need to specify the only, and also which kind of onlying for HAD which is design. This is from a product design standpoint, right, it is a super company. Yeah, we don't know, but for them we need this, we need to.

53:51

Together specify the drum and the fan system, yeah, to find a static pressure range. But my suggestion is possible. Yeah, my suggestion is that we pick up for the high capacity because we can control the fan output by the good exact. Why not, we will pick up the high pressure, and what we need to learn is how we specify the zoning. Also I found a vendor for the nature die. They actually have a software. If you give them the input open air CFM, that is cubic feet per minute, the airflows, they can give you some reference, the same density or open the air or density like that. So, you know, also actually when I joined, I learned a lot from your life for system.

55:00

What do you think about the number two? The screen with me? I want to know it is the sound.

55:09

Makes sense. Some places I. People. I add to that it's a learning area we'll have to see, yes, if it makes sense on paper and that's why we need this team here to figure it out.

55:29

The question,you know,my students is actually I discussed this.So if we have one layer.We want to go soft and.Even though we have a different open area back from different areas.For the s aap one one sap is,you know,four on the screen.

55:56

If you have a big thing, you're done. When you get a layer, a certain layer, you're going to get too much blockage left. That we'll have to find out. Unless the screen has some 3D back, not just 2D.

56:11

Miniature pockets and. I think you showed a screen that had layers? Yes, and it was not just vacuum from the bottom but from the sides as well, like all three. So this is why I ask this, you know, if the fluff Co. It's a secret. 好了，FD后面的S。The A one in four. It really can sap, yeah. You get my point? I mean yes, yeah, I mean it will be a learning, we want to specify this big of a fan as we think it's reasonable, want to understand each C and also the correct material, the fiber to find polocity also impact lots, we need to figure out.

56:59

The screen design is critical. You point out if you just had vacuum on the bottom, the first layer on there it's filled no moreum, but if it had a very.

57:09

Technical screen that had vacuum on the bottom, but in plates that the vacuum is inside, not explain that, yeah. And another background to answer Gavin's question here is in the city pacs trip when the HC first demonstrated this kind of protest to us, actually they proposed three forming job system. Because they add one more three job, just the one to minimize the sap add on each single job, that enabled the kind process to work better, you know. But unfortunately we do not have such a space.

57:47

Unique design, okay, any question? No, I go to the left.Who can talk? Yeah, Brian shared a design, we can talk later about a screen, he shared it's a layered approach, so backing not just on the bottom but.

58:07

On the sides of a miniature pocket? Yeah. The sand pocket, like the miniature, the holder of the sand.

58:17

I will show I will later save the time so actually another risk I don't know yet is due to we have a different sizes about the path, so what's the oldd about the drone that is is quite critical because before we are talking about the height about the jobing.

58:40

Height of the drop in the flap, height of the drop in the stem that will enable the jump to make these formations. But anyway if you are separated, I'm sorry this is AI generated so this may be not correct but it's just the image. You just like this way so I just generated in the train this morning.

59:05

Anyway, if you are thinking about this, this is a weighting, this is a socking area, and this is the balancing about the step, and this is the holding, and this is the nip. A critical way and a follow up we don't know yet is.

59:25

If we want to look for a pattern to pattern alignment, the DR size must be the same. So if we design a big jump, we need another big jump. If we need to design a small jump, this needs to be exactly the same OD job that we are in parallel. So this is principle one. The principle two is based on the product design, we need to have the screen pad to pad without any white cutoffs. That means we only have no sap here, it cut it out.

1:00:05

So after each RPM, the drone itself needs to be aligned once at the first start of the house. So this is a principal tool that will make sure the alignment and tighten things together. And the third thing I'm very interested to know is, I need my boss to deliver me the portfolio. What's the biggest volume coming from all these kinds across these eleven different sites? So we know, for example, on the N thirty three which size we want to run, and only know which size we want to run on each line. Then we pick up the drone size. The most risky thing for this kind of process, I don't know yet. I need the engineering teams, imported design is, if there was a different size of the OD, we still have an installation axis here.

1:01:13

So the nip area the gap may be slightly different, so this could impact the process. Also I was thinking it will be the most risky area if there was a different OD size of the job, and still we set up

in the machine the axis is the same, so the left area may be same deviation. Another design is what will be the right joint size we need to design if we are looking for a big sized drone the.

1:01:50

The good thing is for each sector we have slightly long time that can be holding the SAP to let the SSP go with the air, and then form the patterns. But the tough thing is the bigger the Dr, the bigger the run out and also the bigger the thermal deformation. So imagine if there was a big jump if the run out.

1:02:19

Is not come control the nip area? They were not nip very evenly. This will cost the cov too much. So what is the right size of the drone design? According to the law we need zero cut off.

1:02:37

And also with a different size of the young, we are setting it together. How can we control the nip gap.

1:02:45

That is the, I will say this is the number one risk about the discs process is that if we can have a multiple size product running our machine.

1:02:57

That's my understanding. So today, like historically we've had one drop size, we don't change that. But for this, probably we need to, or you cannot make it. I'm also wondering, like for me this.

1:03:15

What you have shown there and I was written like the new gap or what is the ideal size? I feel like that's part that we should be going to see. They have this two drum system and they've developed a two. I feel like they should know the answers, so this is also some important notice that we want to discuss tomorrow. We'll figure out in the define that what is your run, I think they'll be able to see how and also some kind of remark. Remember the RPM, I think that the design it should be running at close to about one hundred and fifty RPM. And the heat sometimes causes a deformation on the axis, so it will make the run out worse, we should have. The system they use the drums to control more.

1:04:15

They really would you like this? I don't know. I don't think this is the schematic. I think we need to I. That's it's the theory that the layout of the snow is quite different.

1:04:52

Anyway, this is something I think may be critical for the design. I need to remind our engineering friends that currently for their machine design this is for the average distribution of the same density. However, as we want to design a difference of the density of the distribution for some, how do we allocate adhesive. Right, for the same count adhesive we allocate it, it should be

average and it could only fix the defined amount of the sound. And if you want to add the density at some position, how could we add additional adhesive to the surface of the.

1:05:45

Without no, I actually would like to say this is also a good question to friends here because we know the blizzard. No no, for me this is also the ber because if you think about it, blizzard is to have the sap jobs and then also the glue job onto the conveyor but instead I need a break drop onto the job, it's onto the surface and versus the flat surface.

1:06:21

That doesn't exist. Yeah, especially when you need them. The free sample will be blow. Well you're applying you're applying the adhesive to the sand first so if you've got more sand you got more adhesive.

1:06:33

That is particle here we have to combine this with no, we don't know, we need to figure out a you have enough vacuum, you have three d step, but you cannot fix the step.

1:06:49

You know you have in the yeah, if we can minimize we can wax and minimize the glue at all on the breather the process I'm thinking about if you do the same breath, the process we can use here because instead of have a breath process on the conveyor we here we just need the not a good.

1:07:17

Because last the together yeah sense we just finish the trial last weekend and we clean four times strong right? All easy no simple thanli but still easy to put the glue on the ground surface.

1:07:42

Give you material as some, you know, web, web handling problem.

1:07:48

With ILI don't think you can use I another tip another tip is just for this meeting room our friend in png they designed the drum with ceramic, not the steel so ceramic easy to peel off the pieces.

1:08:05

That's only here here.

1:08:13

是什么材料，大哥？我这个英语不太好，陶瓷陶瓷陶瓷的。投资么？因为陶瓷粉末压铸的。

1:08:30

Percent students. Okay, this size is just my idea what will be the John size will do but it need to be verified by engineering team. So eleven different pattern result in the eight different terms.

1:08:53

So usually, I mean historically it's been you have to, you know, there's an even number, you pick a size, so I'm just wondering like from an execution standpoint when you pick one.Size to watch

this, so then when you go to the rest of the sign we will pick a step by step but would have to change the yes so that you change the, tell you the job know there want to change the because your current portfolio of ADS are they multiples of each other so you I mean you.

1:09:26

Yeah, you eleven had resulting like, but it up to your design. My recommendation is up to a different job. Yeah, I think you want Jerry to change the, but each line maybe the volume is good enough, maybe only keep one size, that's yeah. I mean, look at the lengths of your pads. Now changes to a function module has to be screen. You look at those multiples and then strongly consider where you can make a small change in your paddling.

1:09:57

To make them multiples of each other. So if you go back to the old Howard going she fans, they were all multiples of up to you guys, given really well, at least like this. That's a function of a drone.

1:10:10

Is your pad length needs to be a fraction of the drum circumference? Ten screens, the eleven screen, on the whole screen, but they're all in the near future, in the near future, because the like a size is fixed, but the pattern is different. We we just changing the summary.

1:10:29

Be more of a charging.So then you wouldn't be able to do you would have to change up.Okay, so no question, let's go on. So now that is my understanding of all the existing c recommendation. So will be simple. They have basically they keep like a two jobs, two jobs process and what I inputted to the hch is only the eleven different sites we are going to run.

1:11:08

We were told that we need two different SAP dosing plus one additional dosing for the functional granular. Maybe functional granular can be either in the LSS or PS for some chemicals like a PCM or some chemicals like older the control graduates, that's a third system. Yeah, so I'm asking, but still they were not go to the all, for maybe to something somewhere else, so that yeah, but not here. But for the function the pilot we just need to good enough.

1:11:49

So, so another import is I only give the hch three imports.The eleven different sizes, the patterns that is generally showing us the pattern size about these.

1:12:03

呃，叶脉怎么说啊？Leave structure the patterns, and also two different import about the SAP so three imports I give to HC they come with these kind of solution, and we want to have a multi time discussioning the patterns yeah, how again what you told patterns patterns size so they different diameters in their layout yeah, yeah for the eleven side yeah eleven size does the MD size and the plastic e side and also the patterns inside these shapes yeah, this this thischar and also is looking for looking for two different sap head all and also to have a flu.

1:12:58

Request them to different request produce are only asking for two different, never asking them to have a different add on. Different than that, I think we can block sales.

1:13:19

You all now now that we want the capability but, but I need a machine at least for for this gap need to think about all the but there might not be a.Different sizes because some of them are in it but you've got different, you get different widths to not just different circumferences because some are one hundred wide, some are one hundred and ten, some are one hundred and twenty.

1:14:01

OK.And the whole process they have a five different materials,two saps,PSN ls n and also the IEL.But the sensing here,we keep the room for the iel cutter for the current process is just asking for install two different therr motors here to alignment on the tension,but keep it in blank.So in the future we have a long space for the IL culture and again here,I'm interesting to see if the team here can help to design the b blazard process here.Onto the jump.

1:14:45

I think we've done I mean,there's some very rough snipping.That's been done to see how that might yeah good.I think one question that I have for them is this orientation that like this forty five degree offset you know this is my assum it just okay,the detail need to ask people for the idea.Yeah I mean I'm curious if they have an idea of what's better we can.我们一千多。I feel like there's something that's going to work better and that I don't know what's the best yeah,那个。谢谢。OK,so five different and clear.再回到刚才那那张那。And also I'm asking them to have a smaller pioneerport here to enable us for the phase three development.

1:15:54

Another, another thing I don't know, but also need to have a team discussion here on the process.

1:16:03

On the process here after the alignment before the embossing, so assuming we have a iel going through here, so above the iel for example, this Dr is targeting for the lss but assuming if when we can develop the vibration conveyor here.

1:16:28

With this kind of slightly vibration,we are assuming the same.On top of the IL will be dropping into the IL this is the ideal situation we want to developing for the poly side.So the process here is this fuel is making for the liner s side,but if we can looking for a slight vibration here to have the same dropping into the idea why not,we are thinking about this as the policy and the job and once we do the process.

1:17:04

We do the we do the a hundred eighty degrees turning and then go to the inbossing so this is also open question, but we will never talk with AC from that.

1:17:20

One yeah yeah forty to one eighty because on top of the same,we droping to the I idea this is the perfect way for the po that we turn it around and in enforcess it and collect on to the.Connecting to the box,it will be ideal situation need for more open discussion.

1:17:44

Okay.Again.In echo with our hypothesis that the different open air on the screen it can make a different sap density. Actually we already kicked off the screen ordering from the nature light and will be installed on the Tianjin pilot line. This is a super confidential, we will never teach with outside.So the Tianjin, ah, Tianjin forming drone in the Tianjin pilot line there was one drone, there was a four as, so the first as.We are designed the eco density so only have this kind of the travel design to make sure we can get a basic products so this is the first half.Oh, again.The channel we are designed here is eight millimeter for main and also for the side that the the width is also the eight millimeter, but for the embossing what we want to looking for is three millimeter embossing in the middle of this eight millimeter.

1:19:02

So for the second off, this might be too much detail was the elevenmon sizes with the pattern be the same on all ofs and the bosser could be the same on all eleven? I'm just or we're getting too far tas I have no idea too far too far the shoe.Had better to have the same come yeah but but I think the small size and X s maybe the different.

1:19:28

哎，那个克Claire回到第二部第二章再来，And and the second, and the second up the screen, we are ordering to do the try in the coming q one in the Tianjin pilot line is we just make a three section about the sap density.

1:19:48

Why we don't don't pick up the five? Because at the beginning we want just want to verify this idea works on the three sections. If three sections works, basically we can extend to the five different sections. So the design area is the fifty percent of the m lens.

1:20:08

It will take about the ten percent of the SAPR and the sixty five percent of the MD lands we want.

1:20:15

About about about seventy five percent of the sap density and for the last twenty percent of the MD lands, we will add up another fifteen percent of the sap data. So this is the idea we just want to try in the canjin pilot like in the q and s year, try to see if distinctly by changing the screen with a different open air that we can make a different sap density.

1:20:44

Yeah I think that's super important to learn, especially like if you've got ones over that ten percent open ones over its fifteen percent of, are those truly going to be different or they get to great the

say yeah, I don't know so we really need to try to to see any difference all all there must be some kind of deviation, but that we can test that what the deviation and then probably we can correct this kind of open air, but the open air here that are two ways to do it.

1:21:13

Currently I'm asking for a different the same hole diameter.But with a different density, another way we can verify is to looking for the different hole diameters so this could be result in something different when we were building the next stepck.

1:21:34

So go to the third, the third area is still in a line with a different sap density, but it's just like a Brad is saying.

1:21:45

Majorityly we make the screen in a three d screen, so the three d screen we have some kind of the depth that with a gravity instead of the open air, that is the open air pressure plus the gravity, we hope we can hold more sap, so this will be verified on the third half.

1:22:06

So your screen is concave exactly this,but how to do that?I'm still waiting for the detail design.This is a concept that we already feeding to the spring manufacturers.And go to the third.

1:22:23

Go to the fourth, go to the fourth is again there was a different open air on the screen but it's a flat screen instead of the three d screen, but I would like to increase the block on the channel.Around the three millimeters height, so it's thinking about if we can do a nily with this kind of the block, we can do the inbossing at the same time.

1:22:56

There'is a one question density equal weights.Divided by the square the area area sorry for My English but yeah,if you I think with the active cake are you the same volume?Actually you input some volume is fixed.

1:23:21

No, you need to be adjusted because the you need to how to say that how to say that for example, if you are looking for.Millimeter length if you are designed for the solid PPM that's the overload meters per minute you need to work but if you were design a dream here, this is the d.

1:23:47

The hole here, the PI d, this is the length, you divide it, this is the RPM.

1:23:55

But for the RPM, if you're looking for how many Apps, if you divide it up, this is some kind of the Apps you are looking for. So this is the sap dosing. You need to calculate the length of this arch and what's the add on you are dropping here. It need to be have the PLC correlations. So with this kind of rps with the diameter you design, you can know the speed of.

1:24:27

Learning from here to here and this kind of second you calculated it on this certain arch, you need to have a PLC control how many s here, but the situation we one product the like we say on the front end and the middle yeah should be different than in yeah okay that is active ah.

1:24:52

Active tape right for one piece of products like front and middle should be different volume of ste add on yes right. This is sure if you can go up to the two jump pictures because here all the density the stem you put that on is very important, even if the stem you put add on keeps themm yeah which you would right.

1:25:18

In both.For example,if you are seeing this,this kind of the arch here.Actually,there was a waiting.

1:25:35

That's why they'important, I'm saying.The distance between the sand is going down and also in a line with the second this kind of arch is really is important that we need to figure out, we have no data yet so.

1:25:51

Basically this is the, this is the area where the sand actually absorbing by the vacuum.But here need a second step to balance, this is a balance because this is a low slightly lower pressure and with a gravity with the with this jockeys, so you need to think about a good enough timing to ask the stand to have a scall.

1:26:18

How to say that different PSD set it is to I'm sorry My English not good.就就是说给定时间范围内，你的sap里面的不同的PSD的那个力度分布的直径。你让它有一定的重力和离心力的情况下，给它那个流平的时候，其实是帮你在这里的时候，这个等待的时间和你这个区间里面跌落的SAP之间的关联度是什么，不知道需要需要来验证。对我知道你说的说的我大概我能明白，就是那K就是最重要的一点，就是它的SAP单位时间内进给量一定是可改变可可可调整的，对的对，就这就是你sap的跌落是必须要调前对，但是这个其实就是我们那个那个那个，Lock is looking for is upon the search timing is running on the drum for this path.

1:27:14

Actually the worry about the sap dosing it need to be.On still and in correlation with the I want to clarify what I you just said that that triangle orange nozzle on the top,you're saying it's not continuous because right now it's a continuous RPM.No it's continuous and but you are saying you want you you want variable Sam how in is that what you're asking for.I mean the key point is the staing it has to be adjusted you know,during each product yeah,not each product one one of the one what you guys finish talking through is Sam they follows that yes,rough the same feel it if you better you can control,but the sometimes you need to control you a certain period with the what I thought you're your're why the wayt right you know the speeds were going yeah,or slow down.

1:28:21

The feet like yes, but I thought you were doing that with the different otherwise and matters in the screen you know it's both Sam, but do you need both move Sam because I don't think to you're able but the way that different impression will it's okay I we.

1:28:47

Agree it will define on the cov what's the deviation, but it will be better the sap dosing it can be in a line with the amount it be it would be a different technology. Yeah so we need to take out so I was thinking of the product objective is clear the method sounds like there's something, but that's like version three or four right? Well, you get requirement was that you're Correct Yes you if we have, we have but if you want engine to do steady feed okay with the screens to screen the screen you is flat we got to make but you're buying these. This is simple to try a steady and a different and the yeah.The next step, if we make these three d strings work, then we are thinking about the modifi.

1:29:59

Phase one can you just clarify the phases this this zoning is not phase one two or three this is not what you need for twenty twenty correct? I think so. I think so if our engineerity can't deliver I actually I don't understand why if you have a continue.

1:30:24

And then just use the vacuum to move the parts that need this. Yeah, that we need to figure out. You think the vacuum would move the sample? No, no, the reason with this part? Gavin, yeah, I can tell you why because we don't know the gap sap dropping point. As the receiving job is the height, if a certain height is above some ideal length, that was the sap bond back. This kind of the lost set need to adjust the same amount, but if we can control this kind of bond back, we don't need.

1:31:12

You mean the same FE because it is a big space, you need to have more timing to receive this SAP. And for these, but it is more or less, does SAP need to have some back due to the... I know you like your, but anyway, in the Q we just have a certain distance. Yes, certain distance and this is many, lots of learning. Yeah, I think the variable goes off, be very your life, but if that works as to risk, he see, I mean like in the worst case, it depends how much of the one can home back due to you re this because you would know is one, you almost with a combination.

1:32:06

This game as.In a product he wants more or less I know that maybe we are thinking about two different learninging here that in which the area? Yeah, maybe.

1:32:34

It's yeah that's yeah you need this stuff to get the learning yeah s yes going yeah I this paper you no know that's not part of this discussion, this is to point, but these guys in the same like to hide every yes the same own supply, to go slowing down and speeding up during one just the process

what that there is a.No, but, but again in summary, don't make things complicated. The management team, they are demanding, they want deliverable. So let's figure out in this room what's the simplest way to deliver easier.

1:33:31

Up to the two thousand, two thousand twenty nine, beyond the two thousand nine, I don't know if I'm still working in, but yeah, he's one maybe operations. This is phase one, you like get off, you got any of these, they one today is yeah, a distribution difference in the past, yeah they are be right there, that's phase that. And also if there was any good saving point that we can reduce on the standard and keep the same performance, we can easily bring it to the phase work because management gives the advantage of savings for one, maybe this more practical to only discuss the operation. Okay so please go back to the screen.

1:34:32

Well, that's the last bit. So when we are talking about the sgch process with a small hammer mill that is working on the po side, actually, this is if we are dissembled with if some countries is still looking for prisoner, there was a room for the and also for these three is for the face four maybe not critical here. But if we are in here to c h they have a proposal we like. This degree of the forming chamber, so my question back to them tomorrow is.

1:35:11

If the hammer mill here and the hammer mill here can keep the same capacity with the motoring in the inverter, we can keep the same ham of. But we can upright similar to this kind of the angle because it helps on the fluff dropping and helps on the. But again this process and this process the only.

1:35:36

Difference, hch told me is with around ten percent of fluff. They don't need a scarfing. But with this kind of process, they need a staffing, so that's the only difference. But in case if we can build up this kind of machine line or pilot or whatever.

1:35:58

Simply by adding with the stuffing, maybe we can verify the hybrid for the white k. Or all for the other countries who are doing the hybrid structures.

1:36:14

Okay,so that's my little learning and a little interpretation about what my boss is asking for.Pretty just the part we ask,how accurate?Yeah,I is accurate,professor.

1:36:42

We need to the next topic. Okay, do we need the rest or just continue five? Yeah, I think so. Yeah, that was great. We talked a lot about Sam placement and where we wanted to place Sam. The biggest challenge is going to be keeping that Sam in place. So we, we use the term like.

1:37:09

Sam captures Sam immobilizations fans.And the sense some kind the gravity has form back,this will cost the COB and if we can control the same dosing just like the lockage that is also impact on the c o bs well,because we have a limited vacu in a certain period.So this is all question to on the high speed what's the theory we can control.开的COV。A三八零。

1:37:44

Well, it's also the loss of your distribution because if we put it in that profile and you can't hold it in that profile, it will fall flat. So yeah, 所以说我是希望我的解释比较符合杰瑞老板的那个，然后的话就把这个球踢给各程部的伙伴。

1:38:12

对面一直在摇头，我们一般人不敢要的，我怕不腾不住他骂我们。Yes,phase two will work.Do you have that that that's good to summarize it in a way then like can say here are the challenges with phase one focus kind of to.

1:38:43

是，只是西郊这边的争度有多好，真好的话，我他那的。我的意思是专家需求咋问，求你看我都直摇头，头都摇得都不忘了，太牛了，你看能问出那个胶的问题没有？我就突然间跳出来，我脑袋没有，我们确实会有，如果他现在用的就是下Sam交流同时下的话，那他就应该所有项目下来项都交钱包裹，所以就再下到第三个单。

1:39:27

所以以按照我方方式对要说是先铺一层胶，再再刷CP就会就会出现一高不住有点难。

1:39:44

为什么这就是为什么我的答案就说我不到四，我只剩五分钟啊，其实你应该到前五，受到一个人的压力。但腾哥啊，

1:39:55

就是如果用网能够实现已经能够实现的破，我知道你精益求精，就是那你下落的其实是可以保持一致的，可以稳定，就是他双方的意见能，但是实现的多好，其实就是一个c OB的跳值能够稳定不？你需要靠用，用下来的可以做补偿是不是？但下来那个蛮难的，对那个蛮难的，你一圈内你一圈内要不断的你你的变频要不断的变是吧，

1:40:24

少有五六个枪chamber其实很简单，就胶厚度啊，其实很简单，是你要用网的话，那不就粘到网上了吗？它怎么那个一圈三三百六十度没有，因为这样一说，这样一说主要是漂亮美眉在我不敢说没有就是没有。那个Chris就会问我怎么去控制那个线的跌落吧，其实保洁早就解决这个问题了，保这这我真的不敢说，我说啥意，那我这样一说不。我我这一圈三百六十度要换这个点快啊，就是多加个多加个小桶，把a CD接入到小桶上，

1:41:14

小桶先根据那个先排布一遍拉回来，再第一个二次跌落就好了哦。

1:41:21

对对对。三。兄弟，刺客是我说的，要求很高。现在更多一体要成序也会好用。所以他能够通过，这可能早就过，但是现在就是个话题就在于我上班。都保护自己。我其实到我们之间的那个。出来了，大家一起，我讲的那个确实不要。这跟当年对。

2026年10月27日 14:46

00:15

Did you see that? Are we coming back to? 好，这个前期你现在客户还没有那么大压力，现在可能草方案他后面肯定会多一个人。What ranges can you be runn?

01:15

最后要是K其实也好说，因为小的专业下来之后，相对于facebookible，他们都是比较有理想主义的，在的确实是我也特别佩服，不然你不知道，那你那个目标没有到那么高，以后能达成的会是问题。相当于如果说那些选项，我们在这个阶段能考虑来的就放进来的，我就是要先把设备的开类先制进去，刚说前面可能就会，这个确实要考虑。其实我比较好奇的是，他们认为得哥提的这些点是是。I yeah, let's start from here, right? Okay. 你们你们。

02:32

暂时还没有特别想，还是因为他也才刚刚报，然后现在的已有的项目可能都会到我这里。先follow up。未来会看，目前短时间内，因为他负责之前的材料，供应商比较熟悉，所以他会负责外部的source，我更多提供材料本身的技术，他会跟新供应商进来，探讨方向。我们目前短期内还在问未来会不会继续看，按项目就还怕多了，按项目或者是按他擅长的再说。

03:22

Would you consider using coorn for your homic? I think the milk form in the two forms have inhibit a political number. Okay, so we saved the time, so we will go on to the materials. Chris is still working for me and he had a lot of study on the different materials. Today since Ryan you are here for this obsergy, I think Chris can have a very quick summary on what we have on the point. I just want to ask how many minutes I have. Fifteen minutes, yeah okay maybe I can try to finish in fifteen minutes because I have two slides or two projects. Yes, we talk a lot about engineering, so let's move from engineering into the real materials. Try to give you guys a brief introduction about when we are working for the coco Lily of basic six engineering part, what are we doing in parallel from material develop standpoint?

04:53

Okay, so the first one is, sorry, my slices, I just realized my slice is so big that you cannot present in one area, so I try to move from the left to the right.

05:07

So first is about the IEO and we all know the IEO is very important components in our observing form. We try to and we know a lot the pinpoint for the current IEO we're not using in China because we never know how to see the gets a deep study for this material, just to use what's the supplier provided. So we know at this moment for IEO we have a lot of expectation. Take for example we want to get the distribution as long as possible and we want to get rid of the geolo what the prime mentioned of.

05:50

Previously we focused on the sap recipe, but I think we also can do something from the IO, right? And meanwhile, also z direction collapse also that would point increasingly.

06:05

So with all these concerns we did, actually we set up target to develop the new IEO for the six.

06:15

Okay, so here's the original target we set for the I audio at the beginning when we designed this audio material: twenty eight GSM, five different types of fiber.

06:31

In our recipe, I cap hold percentage is what our robot team developed of the best test master to evaluate how many SP ratio we can hold from the IO.

06:49

So it's like that's buried into the areao yeah yeah but I think we this test masters still need to be further developed we can talk maybe later it', R.And also the most of the important part, you know, of the MD direct distribution Les okay.So here'is the formulation what we.

07:10

Designed. At the beginning, five different types of fibers, we have two layers of the Di. You know, the first layer is the combination between the two D P and PT, plus three is the three D. That's the first layer. Second layer we use the two functional fibers, one is a PT TPET side by side. A typical characteristic of the PG T fiber is to have a very high resilance.

07:49

Which can provide the higher resistance of the IO for us. And the another one is the sixty PVA fiber, which is a very strong hydrophilic fiber. But the regular PVA fiber is a soluble fiber, so we ask the supplier to do the insoluble PVA fiber.

08:17

So the second layer, we combine the fold.Fold the hollow yess fiber plus with a PtT pt side by side plus with the POA together so this is this is side by side not sheath core, no not not the she had Co yeah you can think about these PtT has a very elasticity and a side, a side you can think about like a screen so with the screen we want to build a more voice more in the audio and also higher compression recovery, Right Yes Right Yeah.

08:55

It's our engineering a different target.呃。In addition, we also try to find the uh to to elaborate the Fi fiber design to.

09:07

To em.Has the capillary structure from from the,from top to the end,from from the first layer to to to the bottom layer.So you can see the from Daniels perspective the.

09:22

The first two outs, two, two Daniel, three Daniel, followed by four Daniel, seven Daniel, six Daniel.

09:29

Okay, so this is the recipe we designed at the beginning. And here is a test result.

09:37

When we put this idea into the finished product. Just down this in the middle of this bus. So you can see the most benefit we get from, sorry, the smaller small is a, is a.

09:59

Ah,the first thing take speed,right?It's a almost six percent ah,shot,shot and also MD direction,a distribution under the cradle.It's about seven percent increase.

10:15

Okay, and also we get some benefits from the uh, the high pressure and low pressure in take, but we also get some price.

10:27

Can see for the Revit and leakage so that's a that's a check off.So in general, it seems like a twenty eight GSM new IEL data have a same voice volume compared to existing when using close to thirty eight years.And the whole because the more polocity inside the sand holding capacity actually is almost double compared to the.

10:57

So we are using the two d and the three d for the binder to bound its strengths,and with the hollow fiber to increase the voice volume and the PtT side by side with the pet to work like a spring,so it make more resilience but due to the PtT fiber is using we haven't figured out how to improve on the hydrophilic capabilities,so that's why we had a PBA fiber.VBA fiber is more work like hydrophysics improvement.Okay,yep,sex.Okay,so.

11:41

Let's move before I move to the cost part, let's see this part, yeah.

11:48

Here'is the test result at the material level we we do that, we did a test for this I audiol versus the current other commercial audiol without without any other components of the diaper.So here we we we can see the first one is the IO, and you can uh most the traveling parties that I say sap whole percentage, sixty two percent versus uh uh other area in every at around maybe just twenty four percent.And also we got the good rat.

12:27

At the lowest roasting.So I wonder if you've got that much more Sam embedded in your Ariel? Is the Sam swells, is it taking up the void value that the Ariel was meant to have? Like your sand particles are swelling into the void volume of your r EL now.Because there'are so many more of them embedded in the areao, the X that's the part where you need to figure out in the in the

second round of the trial maybe, because you know if you look at the various comments actually the proxy of this I eo.

13:03

The bottom actually I want to reach out to later because we did not, we don't have any test master to do the about body for the material okay we have a test method, I I saw it from such out from the our internal website, but I think we can discuss later right and also compression recovery we also need some support as well and just from the initial performance test, it seems like we get improved on the first time and the second time but a slightly.

13:34

Was on the third time credit in take fe, so what we are's function is because this kind of r idea we have been made from a pilot like instead of the production machine, so we will try to have a more stable structure coming in the next run to make from the production machine. Another way is still I think a good talking point because currently iel has been winding onto the Bobby, it's just like apoing go. So if you winding onto the high voices volume I year onto the schooling low, there was a tension applied during the winding process. So this kind of winding of the timing, it actually pressed the high waterid volume I year and once you are moving out the a chin line actually the maybe the timing even we have the PPT, which is a high spring material fiber you'something that timing.

14:34

Air is's still not good enough to release it, I was war so my next question to the engineering here is can we demanding a different winning process for the IE for example, it's like the box collector so that we can keep less ten, but they keep yeah, it well and there's there's different types of winding of the schools to there's there's core winding and then there's service winding and if you wind from the core only.

15:05

The material that's closer to the core is going to be well tighter if you do service winding it's more consistent tension the so yeah, maybe not that for the regular I but for this type of I maybe it will be very important. Actually we did get some finding when we did this test, this material test.

15:27

Especially because if you're getting a better distribution of fluid, you would think that you'd be able to get more in and that third intake would be better. Actually from a material level test standpoint, you can see I don't know how to winding this idea could be a very critical discussion in the future. We keep this kind of voice rolling during the timing so I don't think the current schooling law is best fit. Have you tested a hypothesis with samples from the core versus samples from the top.

15:59

The post of episode core versus what product made with material from the core versus material? Yes, exactly. This is the first strike through time.

16:13

For the material test, okay, you can see that it's a versus other materials, it's not that good, right? One point two.Second versus just three point five percent zero point five segment, who's making the second, sorry, who's making this material.

16:30

Back to the right point. This test material, this sample material, is produced by the fiber producer during their pilot machine. So next plan we want to move to the commercial nonwoven manufacturer. So back to Brian's point.

16:51

If you look at the test test results from finish standpoint, actually the first.Absorption, absorption time actually it's a, it's good, it's better, yes, yeah.

17:05

So try to echo what you asked, so material sign and sorry, so what's your question.Yeah, I think he's trying to say so if you have a role that's this big.Not that big well even. Oh No Okay you mean the outer and the the inside. No it's a because it's a, a pilot tribe actually our road is pretty small pretty small actually we we, we need your help because you guys are experience how to design this kind of the loads or even in the boxes, that's how we can re releaseve this kind of tension during the winding so because this is a very high voice volume material, so if there was a tension applied onto the wining if you are diminished this kind of benefits so yeah we really need your tips. How we can teach the vendor on this winning process yeah we. Have winding experts, yeah, so, so one of the follow up.

18:03

Yeah actually when we did this trial sample at the beginning the sickness of the IO is almost two millimeter but one way get it to the Tianjin pilot line, it's only off if loading and gas right there so I think that's it's probably capability on their pilot line to, I doubt they have a lot of capability on their winder on the pit yes for sure right on the other hand the the basis weight is also.

18:31

Moving system yes but the encouraging thing is when we will see the off my on the who make this kind of idea actually twenty eight years there.

18:43

The the height or the voices volume will measure is equal to about a thirty eight so these are benefit, but we diminish this kind of benefit it just during the winding and also during the transportation in the timing, so we need to pick it up another thing is the fiber with a different fiber like two or two dael or three dael here, actually we get the enough stress for example we are talking about cutting the I in the future, so also we don't know if this kind of is good enough for the trip.

19:20

We don't know yet, so here's uh, actually the IO sample I put on table yeah, okay, is far east the one that's providing cyber? 是。

19:38

They've got some resil fibers that other fiber manufacturers got. You can easily identify the fluffy car side versus a normal compact competitive. So right, we can discuss this later after the meeting. Yeah. Okay. So the next one, just make it quick. The key advantage or expectation we are looking for from this.

20:15

Pipeline is we were charging to use the tri levelable fiber into the liner, so here we are using tropical liner. We do not need the adl in the current design, so in the tropical liner we just think about adding more trilateral fibers.

20:38

Yeah, try to increase the surface of the contact and to have the MD distribution and the weaken, that's the key target. So you can see we also have two layers. On the top layer we have two percent of the fiber p, and on the second layer we use much more, up to fifty percent. And here is the benefit. You can see the MD distribution cradle.

21:12

On the gradual, it's almost eighty percent increase. And also gets some benefits from the total capacity. They see the one first, second, third. Some intake also gets a good improvement.

21:30

The trade office and all the rat and the inftake time easy and easier.Another benefit that Jerry's t is just do the try with the ultrasonic about,we used to buying the nexus light from India that offline,but with this kind of by BI level fiber,we do this next not nexus it's just a three d pattern al liner with ultrasonic bonding process it seems like works,it just like the part of the yes the first first layer is a similar like formulation the second layer is.Just carry yeah,yeah,yeah.OK.Okay,so I think that that's a general information I will share.Ah,actually the for that uh,the face two act with the ultrao bound I think we're still waiting for the test results okay.It's just for the the purely tradable fiber liner.OK.

22:39

Any questions? I think that we can talk later separately about the material, I guess I'm curious, right? I don't know the material, but like from a resiliency standpoint, some of the things that I heard, I feel like there's other work.That's similar and I don't know.

22:58

There's something I agree. I think there were duplicates. I think if we want to better use of this idea, we need to think about how to win and not to diminish on the pressure on sacrifice on the.

23:12

One so we're having the same problem right now with one k they they've got they're using the teare down the process yeah for their topical liner as well, and it's coming in crushed and they don't have a lot in as they want so what we're doing almost the exact same thing just for a different application that.

23:33

Okay, yeah, that's all for my part. I hope that III drop back sometime.Thank you. Okay, so we hope we are still keep the timing right.

23:49

Twenty minutes, thirty minutes, thirty. I'm not going anywhere, I was just. 下南和北，下一步是去北场吗？这还有话题，我不知道下一步我们去北场吗？还是还有一个，还有一个，还有吗？还有，非常快。

24:26

花裙？So Gavin will show us their tribe recently.对啊。Actually this,this deck I shared is.Me againan before.对of the.The deck is a helpful.Trail it's just a quick,quick update and and in.Sunday we finished the third time.

24:56

用了SSA。

24:58

Discusss two brains it'is just a.Very initial check.Because you actually when the.什么信息？我能在你的boss啊？Send a request to me for the.Actually, we do some.Check check for in in the other vendors like in China o.I don't know if the pipeline from changing and also some OS have some.But my point is it similar kind of.So maybe it's have a little different right.But it's still drop, so.We we want to do is like because we.We try to figure out.看了就是。你上班。Smart方的。Performance check.Process and.So.

26:22

What do we have done on the?Second shower.The drone and we dropped the material on the.Current and we do some modifications in the inside the drone and what we want to.Ah, chain vacuum inside, but we can'do a lot because.Record has already fixed that.

26:50

Can?Vacuum and we use the.Can we use the screen is what we use the last for?So in the diameter zero point two five and we spray spray thehesive on the substrate before the wrap up on the.And we can see we move.

27:18

Government and we met.

27:22

Le area to like to do the position every year at the no vacuum so this is a very initial process but I I believe this is kind of a.

27:40

Seminar.Concept with the.O and maybe I don't know,做的做的。Okay,so we also use some pretty,pretty parts to test the,you know,the.What,what kind of we can do and what kind of we can and we do some analysis,so.

28:11

Let's see some pictures. We can see we designed the segment because we want to capture and do some codings, we want to capture the materials on the ground. So this is a me, it's a very simple me and such material. So this is the second trial, we run the machine at a.

28:46

One thousand two hundred PPM.And we checked the.Also we get the samples,so.But the issues there in.

28:57

When we're on the show,we see a lot of three signs in.After,you know,after the drama,so we do a lot of.

29:07

Settings like the same on intensive patterns, tensive. Also, the model change like from signature. This is the because. You can say we in that trail, we're also adding the IL in. Before rough the material on the drone and we see the benefit for the.

29:39

Same capture, so we use the Pearson and we together to combine the I drop on.

29:48

See some details. So this is also a very initial checking, because when we check the process all from the OEMs, they have two types. First is like they use a kind of chamber. And some banners, they use the for shoot like a changing.

30:21

Like hch, I don't know, maybe you go. Kind of chamber so we try this so the result you see. We have a check, but actually we don't know what happened exactly. The chamber is helpful for the.

30:41

Former distributions. This is on knowledge gaps and answers. This is the samples we get in the second time. So, I put the test because when we get the samples, we want to do some test to check. What is the differentiations with this? This is what we get from our share, this is from 5.6 from OM and this is what we get. We find actually, we find the issue of this and this is why we have the third time trial just in the weekend. So because we find, must use PA PI of the channel for you have same same amount?

32:00

In ultra and we compare the cradle time it is very very. So this is why we want this is also the questions I. Jerry share的。 Result from but like I want to know. Widely channels. You have the. S

have the. Yes. So. And then we do some tests to check so this, this could can, this could is from a. Trail. 这些的。 See from OEM this is you can see the smalling pictures have a different the channel. 只是一个不是它只是一个实验阶段。 And then we do the third time trial, I'm not complete the part. But what we tried is.

33:23

是么？Waiting信该报什么意思？We used the one material. Rough on the Dr and use the same concept at the same time but the difference is to be anyone more or. Continues there and. This is a. Pictures from the. Child so.

33:51

From the process, just for this kind of thing. I mean, use the drum, use vacuums to just get the pattern. It can.

34:10

We also do some tests, change the CP. But this time we get the sample like the first layer with the pattern and the second half with the. The period of time become better.

34:26

之间的那种措S反应。Have run of different panels. So, the data I'm just.

34:36

We will not complete the test,but we want to see what it will be.Of change about some amount of holiday.签是签的商品，交流是阿姨要交。

34:52

九八幺五SMS查到机制。Called the outfit.忘了。The draw.So, um, from the technical you you kind of.We can achieve like.It's not a.A story of.Verifying process, I think.This is what we do in.Several times check.Try not to protests.Okay, this all.Thank you.Couple, couple questions, so this if successful, which you've shown in the trial.This this would deliver what jury'is looking for for twenty twenty nine with without the c h, no no what are the what services about the trial results right on the thirdr trial what's what's still concerning is it.

36:02

Products or process even the no no what needs to be developed after a third trial to be commercialized process is a free salmon process is it product.

36:17

Jerry wants no sand in the chairs. This design has one layer of sand in the bottom that's kind of like the option, okay. The jury walked to embarrassed, please. Yes, but why, why do we need?

36:36

Two variables strong,but you can see the product.A second we have a.好。But I don't think we can have.Performance to make it.Of materials in life.Different.Tourisms which是。Maybe just one more question you ran.

37:09

Many levels of sound density.Can you go back to the table? Like where at speed is your current sand density level.

37:20

Versus. One layer in the product, so one layer of your product has so much sound in it.

37:32

More grams?Yeah,how how close are you to the same density of our.No,this is a step two version,this is uh,we actually we already yeah,this is only step two that we based on step two,we already make the FPS request even the FPS a to eight.And that was okay at speed without lo sound in the process.

38:00

Looks like it, looks like okay. So your problem is you just need to prompt them. So what prevents this from commercializing is a second draw.

38:16

Yes. Several long distance. This is just an. Because actually, from my point of view, I don't know what is. This is why I, yes, I want to know what is the. And how to detect. How to do. We can't discover we can get this kind of things. Easy but how to make this to the. And how to. We run the machine continuous seven days, every day, every time, you know, four hours, how to detect. How to ensure the? 好了，对，OK. This is all the questions and this, we can't, you know, I mean if we just want to get a you. But how to manage? We get exactly like this, seven densities, seven distributions. How effect. How to do. 谁的 how to? How to act the. Plus you. Shall we reclaim?

39:57

If you a little. Change of the. I just asked these questions because it's going to be the same challenges with hch, just a different provider from Sandra. This is wrong. A bit of that. Machines with high speed. You ran this at a thousand or twelve hundred. The masters SP of for the second in time is a. Yeah, yeah, I mean it's about that there's some very promising talk with some also looking for maybe this is not market. It's not a challenge, it's all in all.

41:07

第二位。For us, but we need from my point because I'm engineer, I need to consider if you really want to do this. Max is all equivalent to all.

41:21

Windy space and the structure change and.The sc process.So this is my concerns and this is also why I asked the question to Jerry.What is the?Excuse why? Why you have two pals on the.It's better in one I just explain right now this is why from this is not from from me, this from business objective if we have a solution team and we show different options somes.

42:07

Team. This is not my personal decision. I understand your question. If we wanted to figure the two layers happen, that we should deliver the solution like catex in time, and we can provide this

solution to the leadership team to decide whether we move forward with this direction.

42:30

All we need to change the direction of.So that is the.But the reason we got it here, we brainstormed the final solution and did it all in the future.

42:43

Just clarify, this is not my division. I think you should keep track on how many times you're asked that question. You're going to keep getting ascid. It's probably good you can keep getting.

42:57

Not today but as the developer,but I think that everything done that is good because we learn something from the process it's just like Jerry said it is the managementin condition making so yeah,uh we just come across that we need to go with a two direction,due to it's not only just like a patterns pattern is just like I say is like a zero SCP density.But what we were looking is for more flexibility in the future.

43:29

At some point in time you might. Another point is that we have a following FBI I project looking for more like a cooling diaper. But for the cooling diapers and the temperature regulation standpoint, actually to with a clear patterns which will give more breathability. This is also important to the consumer.

43:55

But like what did in this trial this one point really amazing usic. But I think that's amazing because we approved that in ju res. Yes, I mean that point we want to apply as a case because there's no other vendors, all our competitors you don't know our way, right? So we should keep inside because seeing that this kind of process the same loss is really good on.

44:28

Yeah, and another thing is sometimes we need to align process and also free we need to think about how to involve in this.Yeah, I mean, the reason why I'm most interested is this learning is directly applicable to hch dropping Sam.

44:48

A pattern drum spring, adhesive materials, yeah, the only slight differences are choice of drum diameter and how much static pressure or flow through your back, but we'not sure, maybe the fact that you're dropping from way.

45:05

Have a different sand velocity.Otherwise,it's directly comparable.I'd discover how much sand density you can put on a drop before it flies off.That's why there's a connection between your money.And the next one I would appreciate you with this is the step in.

45:24

Actually some point,some point we we don't think that out but we don't want to release so details we only basic basic like what Cha do,do you have do they have a chamber.Ice sta.

45:44

If they don't have a cham, it's totally one. It looks like one, maybe a small one. If they don't have a cham, two different. Nothing is sort of different process, only looks like that. But there is, yeah, the same delivery is different. But it's still a vacuum, so.

46:03

Yes and I wanted to ask did you use that other method have a long shootute Right Yes we try you have one preferred over the other yes okay, we need to move on very very I think a is possible that we can share a little bit in thirty three layout so before we go yes problem.

46:36

腾出你的时间控制真的很。刚好在我他妈需要一下那个量，然后我们刚好过去。有一个那个那个。然后，对。就是。

47:20

So so you want to see the ah this is the current not the current machine but current ah machine bait we are try to put two drums there, this is like a draftter layout so anything you want to know more.

47:36

Care so what we're seeing there is like two of the current guest, and not not count on zero zero currently is the always zero one they only have blizzard process because this machines they don't make the flu them for that, so after we upgrade to blizzard we cancel the drawum.

47:56

This is just a layout. We try to put two drs inside the space need what is current in the thirty three zero and there's no am space good.Yeah Oh that's the that's the end of life yeah, when a nothing only the only ber.有，现在哪有，就是网络事。不是，这是他旁边的不起来，实际上现在没有推。

48:39

原来是乘以拆掉是什么意思？不装了。装不下呀，人留了一个呀，装两个装不下。So you have to move, you need to move the one blizzard section. 已经做好。What you need to move is the one blizzard section. You have all of the space, you have to. Yes, actually. And because this is machines, the origin plan we need to produce the current products, so we have to keep the razard the one the other way, otherwise we cannot complete the current process.

49:14

Okay.Yes, this the first one, second one, so for some baby products we still need this process.

49:27

Do you how much space that is in comparison to the hch layout?Like is that enough space?I't know uh allow is six zero and six zero sixteen the.Sixteen total total meters.

49:54

But those two drop those two modules are is based on our best our kc drops count we don't know what is the h, we don't know yeah I don't have the drawing now it part of the concept is like, you know this area because we remove the Dr we just pull the back.And this from here.

50:16

To hear.If we want to add in one more from here.The need这一部分都新增插入了，在里面我们还要放一个个的。To this area.So it will be will be a big.

50:48

And this is the raw material channel we need to build a second second meanic cross the raw material channel this way to put the.

50:58

Looks like I seef osprey system.Ospyspy system because two oneum maybe we need two osprey system or a big one? Yeah, yeah there vacuum.Systems.And there.Maybe to some loading system, to some infinity system, so we need more space as well as.

51:26

If I.See the.There may be no one,maybe no.Invest how many farms?Right?Yeah.Uh,so I heard before,uh.

51:49

Reintroducing pulp for swath, where will we add the pulp online? Like you have the yellow column that's the end of the mezzanine. Where's the tractor aisle or the machine before it's over here.No, we don't have'like the what? The yellow column by the three zero five zero zero, the end of your mezzanine.

52:12

How much room to the right do you have until you're at the building wall or the tractor outis? I mean, this small? Yeah, that's where you can put your pole.

52:22

Looks like we cannot put the pop around here. This is a raw material. Channel cannot be used. 通道这个到O。

52:36

Like I say, some other country that make the directly up that, that time we find that space is okay for only two laws for one time, no spare, yeah. But where is that unwind going to go? On the first floor.

52:56

No, this is raw material channel. You cannot put the UN onlined here. Can you point to where the pulp UN line is? I mean now currently it is worse, yeah, but in the new layout you want to introduce or no? I don't have the new layout, this is just a draft, you know, based on our counts or just a draft one? Currently no, draft one, because we don't have the equipment drawing from hch. Partial math.

53:33

Boy, that I guess my general takeaway from it is a lot of modification and thirty three.

53:41

To get a pilot line capability. I feel like it would be a lot easier to do that.

53:48

With a separate line. Focused on the courses. I think it's going to be really complicated trying to get it all to work for something in this line that's going to keep changing on it. Have it all there, that especially on the.

54:10

Do. Is there currently any room on the second floor mezzanine for all these care systems for a second? Yeah, we have a. Our system because it's. Yeah, I'm not sure we have now, but before we had we have not a standard. It's very small, very small. And now I'm not sure it's c may have magnetic is very small. Yeah, so I guess I mean long story short, like says that's a lot of work. These people rebuild and if you're planning to run a.

54:52

Fiber at any point in time, you need that fiberizer. One of your two chambers, this is a pants machine, so your poly site is going to be down. Yes, yes, it will be, you'll have to put your fiber in first. Your first layer. Which is good because it would be towards that outside? Yeah. When you go to the site you will see here it's really hard. Maybe you can try a ninety degree pop just like a five mechanic. Yeah, the machine, the pop in like this way, ninety degree, ours is one line.

55:36

Straight up, yeah, it's an option. Yeah, so maybe we can go around and try to understand.

55:47

那我们去现场看看吧，那边好像会失得很远，他们说我把再回来了。好，对。If you want to have a learning plan,you could probably. Maybe.

2026年10月27日 17:11

00:00

We just want to check what's their existing design and want to better understand because currently they just gave us like a process layout, but we want to understand what's there in detailed.

00:17

That if they can show us yes anyway just like today ask them to show us detail because if we want to design a be or something, we need actually we already use an agenda to AC after them to prepare and from the tomorrow, I think that we have a couple inputs already because I already shared that the eleven different sites that we are about to go this is important to design the.

00:47

Forming in size and also the lip gap. The second import is we already asked them to import. There must be two different ass building system and a plus potentially another one, but not for sap and for the. The third input is jerrysing or data of the channel patterns.

01:12

Sizes so charter factor sizes based on the dispute that iation to. 这个也。 Already I told you it yes potentially that add with ten percent the small amount of thelo at the qualified. So they know that, but.

01:34

They are already building into this kind of design, so this is the input that we already showed with it.

01:41

And thank you for Michelle, that is covered with the current NBA a. So this for import we already go to there, come back their design and with the expert here tomorrow we want to go.

01:57

Cover for example, today we have showed the detail mys about the but tomorrow we not show we 肯定是ask the questions whatever we care.

02:11

Maybe we just separate on the different process asking as you let them to demonstrate what's the confidence level on the that they so we think when we will have.Confirm information from s sh we say okay,all right.

02:31

Machines ready.I think it was based on what's the base platform?I was say for the f c,we only asking for the base platform.Like the flat flat or the same sap density one and also do the.Do the channel characters.

02:55

Also maybe for each job, we need to confirm with them what's the maximum SAP add up from each job they can do on this kind of design, and based on that what will be the designed job size, what will be the designed vacuums and what will be the design.

03:16

A mixture about the standard no height or what have and what is the arc about the duo that receiving the. In class with the bank, all these kind of detail we want to check but I'm not sure if they will deliver us the hundred percent of what we want. It's just we want to ask him for as much as possible. I think we need to understand their background.

03:40

About current probability of common technology I doing said. Other improvements and modification from our side, I think we just need to. The more, as you mentioned, we just need to obtain as much as possible information from them instead of lose our.

03:56

Yeah but the one common understanding here is for the cell density of the different open air design, this is highly confidential with the kc go touch. Another thing is.

04:10

And just from the way of working standpoint,I think we are heavily rely on the team in this room to.Kind of Co Vs process.

04:19

Is not only if g c they have an option, it is just our option so so it's what depends on how we build up together and how we retrofit that if the team here is confident enough, we can build ourselves let's build it ourselves but if we think from the time standpoint, from the cost standpoint of from sensing.

04:41

Risk, we don't know, we just looking for some kind of combination so it's the choice is within this team.

04:50

So it sounds like the principle of our discussion is timeless. We just need to understand their technology. Because we told them we are interested in their process, so they should have the responsibility to show us this.

05:07

This process is sound enough that we can.So for tomorrow and the day after tomorrow, half day, what we will.

05:16

Big question to HC is how can they convince us that process is sound enough to give us a confidence. The other is just from the IP protection standpoint. We are comfortable enough. Cognitive feedback at that point.

05:31

Just to make sure that we need to have a further discussion with them on the joint development, right? But I think we need to put it on your input as well, yeah.So that's my idea, I'm not sure if any new ideas from the team or any.Common understanding we, you what?But anyway, I only show to HC character the product size, this is important to deliver.

05:58

The drone size which is important, I showed them the pattern design one pattern design but once this pattern design is come back we can change ourselves for the any type of data ourselves, we will never touch with the.

06:14

The lss or the pss, I think if we can have a machine baseline to learning, we can accumulate our learning and we can develop ourselves about how to make this kind of that.

06:27

How we disclose the pattern to them? No one pattern we need to disclose because this is the one already discourse or not yet already? Yeah, because they need to have define.

06:39

So what kind of, I think that this. Seeing to Brian. Potentially, I think what we're saying is that they're developing a solution, a pattern in two layers and. Yeah, I go on the screen. Deliver that full solution.

07:20

If we have confidence level we can get ourselves, we never cul that experience because it's a hundred percent KCIP, right. But I'm not sure within option one, with the two channels and the two layers, I don't know if there's anything. It's the things beyond that.

07:44

No, the two channels aligned together actually is a basic requirement they already know. Yeah, yeah, based on these data. Have their of this manufacturing precise and equipment with the two.

08:04

Layers of the pattern, the same pattern together so they have a pattern. So we during our PC, we have identified that.

08:15

But however, I think we need to figure out how much we could modify upon that. Yeah, when we purchase the equipment it. 这个擦个边儿，让他们不下。然后我们只是通过做我们的，然后那个。 I.

08:50

Currently, given our master agreement with HCH, we don't need to disclose what we carry. We have tools in existing machines or whatever we want for maintenance use, modify and improve.

09:12

Use a lot of. I think the critical points we want to copy as they have that. I think it is a critical risk point that we want to have a more deep discussion in TC: when is the jump design, when is the alignment of the patterns. Also another is how good they can keep the pattern shape across all the process, because sometimes if you already focused them, but from the process side maybe the free step already modified or.

09:52

Moving the set that is caused some kind of failure. Maybe some channel has ASAP, or maybe the pattern really change.

10:02

So I think this is basically a few tripgger points that we need to have a more question how about how about the.

10:14

Density we just give they like from fifty GSM to twenty six yearssm different different areas of differentsity I we can't just put this as a requirement.

10:27

We don't care anything about technical, but we can put this. But I'm afraid because they are not manufactured for only kc. If they have this kind of idea, maybe they are smart.

10:43

But my concern is we never touch, we can bring back the window of ourselves, we don't have any invention disclosure right in place for sal.

10:53

'I think TV is preparing for.Central Pro providing well.Plus I'm not,I'm not sure they need that to develop to.Develop and deliver the basic equipment.Yeah,but from my point is the.V six,maybe the density.The yeah,average density critical,yeah.But we.

11:25

会看。Buy anything from mch h.Questions like this, the ADS stand density, I think it's important when you ask them, well, what's their capability.

11:37

Make a channel and to keep the shape of a channel? Yes, they should explain that to us in terms of speed and sound density.

11:46

It's probably trade off curves and speed and sand density which you're finding, right? Yes, they are probably facing the same challenges your project is facing as my sand density goes up, my speed limit goes down and.

11:57

As my sweep goes up, my sand density goes down.They can't characterize that for us.And yeah, but but just from the IP standpoint, ah, I'm not sure if we release this kind of information we need which kind of document, but just from the design standpoint that we really don't want to touch.

12:20

Because they are smart if we are looking for the same density.Sooner or later maybe they will realize and do similar research and that they are selling the to someone else?Yeah,absolutely,I think.What we need to.Obtain the information from them that based on our current product design and.

12:40

And.Reverse to the design on the machine and the engineering side what did the black.

12:48

How the specification configuration for the machine need to uh, like obtain to achieve our product design? That is, we don't need to dispose maybe they are smart enough to make up?

Yeah.

13:00

To that detail but I'm not sure to what is to what extent the information we could minimum extend maybe we need to create a smart question, part PID that we've talked about is we're looking to buy equipment.

13:16

To put a basic equipment specification together.We need to go a certain speed.We need a certain range of fluff delivery.Need a certain range of sand delivery volumes,right?We a certain number of sand delivery systems.And then pick a basic.

13:39

A representative product.Can test that?Without showing them like our faces.So just some sort of simple product design that they can qualify.It has maybe a low density and a high density.

13:56

With a single Sam what'we sure how to.Then they can improve the equipment at speed that they can hold a Sam of our choice at speed at a density that.I think maybe this is a good idea, for example, for this we can give them like a.Design but with a difference and density. Just ask.

14:20

Learning with the reliable products from.Maybe this will be vary from maybe one hundred GSM to.Maybe.

14:33

Maybe sensing three hundred yearssm, you already care of the basis square feet.So far not yet, but I just a big ask that to running from single job from the fifty yearssm to two hundred and sixty, that's ironic.

14:51

Parcels ation yeah, so.

14:55

Other res form like.This area is not like that.Pet different areas differentsity you only the one this is just my suggestion we need even they they're very smart but.If this is a critical thing in our project.They did not provide any technical.

15:25

Only the basic.Requirements are unlike the.Density of the.High density in the front bed and the whole.Just my suggestion,if you guys really think it's.At this stage,I don't know,I mean,if we ask them that.

15:55

How does that change their basic equipment?It would be better to see what their capability is by the IP from the screens and then see if we need to add additional processes to that.

16:10

Can't do them ourselves.Don't want to build them ourselves, they can be machine.

16:18

But the same distribution.Only just to US We need a.Some distribution for different zones.But I don't think they have a kind.For their college telephone.去。

16:44

Marriage.Lecture some some.Deadline.To three d screen.Also have, I know they also have another year, they have a two different sap building on to the same Dr.Also can deliver like in.Other here is not like one to one in the.

17:15

Zz uh, the upper layer and the bottom layer it just on the same layer they can have two different.

17:22

Side by side, side not side by side, it side by side is easier but it's MDMD.But it'is too complicated, I don't want to pick up the.

17:37

When we have a the work I mean are we talk about all the design criteria write down.Yeah, probably we just do it just a discussion.

17:50

I think maybe an easy way is we just figure out it tomorrow and asking for some smart question, maybe for example, how they control the same job per second if we have something change.I think if we'are look asking for different density maybe.

18:09

Too enlightening to them. I like the idea of having that written down. I mean, then it's like this is what we're going to talk about. We don't know what I'm going to talk about. I'm sorry, I think we probably need to go.

18:29

逗死我了。我去上洗手间了吗？但是不管怎样，我想我们也许下周，我们下周。
